

HEIDENHAIN

Evaluation Electronics

For Metrology Applications

For many metrology applications, ranging from simple measuring stations to complex inspection systems with multiple measuring points, HEIDENHAIN supports you with compatible evaluation electronics.

Their functionality is always oriented toward the specific application. Whether for an SPC inspection station, profile projector, or measuring microscope, the HEIDENHAIN **evaluation electronics for metrology applications** are the right choice for your measurement tasks.

Digital readouts from HEIDENHAIN for manually operated machine tools optimally support the operator with practical cycles for milling, drilling and turning. You can find these digital readouts on the Internet at www.heidenhain.com or in the *Digital Readouts and Linear Encoders for Manually Operated Machine Tools* brochure.

Evaluation electronics for measurement and inspection tasks

Further information:

Comprehensive descriptions of all available interfaces as well as general electrical information are included in the *Interfaces of HEIDENHAIN Encoders* brochure (ID 1078628-xx).

For the required cables, please refer to the *Cables and Connectors* brochure (ID 1206103-xx).

You can download the operating instructions in the desired language free of charge from the HEIDENHAIN homepage.

This brochure supersedes all previous editions, which thereby become invalid. The basis for ordering from HEIDENHAIN is always the brochure edition valid when the order is placed.

Standards (ISO, EN, etc.) apply only where explicitly stated in the brochure.

GAGE-CHEK 2000

EIB 700

IK 220

ND 280

Evaluation unit for simple measuring and positioning tasks

The ND 280 evaluation unit for one axis is suitable for measuring and inspection stations, as well as simple positioning tasks. The universal encoder input permits the connection of all incremental encoders with 11 μApp and 1 V_{PP} signals, and absolute encoders with the EnDat 2.2 interface from HEIDENHAIN.

Design

The ND 200 series features a sturdy aluminum die-cast housing. Its splash-proof, full-travel keyboard is built to handle shopfloor conditions. For displaying the measured values, a graphics-capable screen shows the status display and soft keys.

Functions

The **ND 280** digital readout provides all of the key functions for simple measuring and positioning tasks. Expanded functionality is offered by the ND 287 evaluation unit (e.g., for metrological acquisition and statistical analysis of measured values). Thanks to its switching inputs and outputs, the ND 287 can also be deployed in simple automated environments (see p. 8).

Data interfaces

The ND 280 is equipped with serial interfaces for the transmission of measured values to a PC or printer, for the input/output of parameter lists and compensation value lists, and for diagnostics:

USB
RS-232-C/V.24

²⁾ Depends on the signal period of the connected encoder (Display step \approx Signal period/4096)

ND 287

Evaluation unit for measuring and inspection stations

Thanks to its extensive functionality, the ND 287 evaluation unit for one axis is well suited for measuring and inspection stations, and can also be used for simple positioning tasks. The universal encoder input permits the connection of all incremental encoders with 11 μ App and 1 Vpp signals, and absolute encoders with the EnDat 2.2 interface from HEIDENHAIN.

Design

The ND 287 features a sturdy aluminum die-cast housing. For displaying the measured values, a graphics-capable screen shows the status display and soft keys. Its splash-proof, full-travel keyboard is designed to handle the shop floor.

Functions

The **ND 287** provides numerous functions for the metrological acquisition of individual values, including functions such as sorting and tolerance check mode, minimum and maximum value recording and measurement series storage. Based on these data, mean values and standard deviations can be calculated and displayed in histograms or control charts. Thanks to its modular design, the ND 287 permits the connection of a second encoder for sum/difference measurement, or the connection of an analog sensor (e.g., for temperature compensation).

Data interfaces

The ND 287 is equipped with serial interfaces for the transmission of measured values to a PC or printer, for the input/output of parameter lists and compensation value lists, and for diagnostics:

- USB
- RS-232-C/V.24
- Ethernet 100BaseT (option)

The transmission of measured values can be initiated on the ND keyboard or via an external command. With RS-232-C/V.24, this is done using the software command CTRL+B or a configurable internal clock.

Sorting and tolerance checking

With the sorting and tolerance checking function of the ND 287, workpieces can be inspected for dimensional accuracy and sorted into classes. The result is shown through symbols in the color status display, with a corresponding signal applied at the switching outputs.

Display freeze

For readability, even during rapidly changing measured values, the display can be frozen with an external signal. The internal counter keeps on running.

Mathematical consideration of a second encoder

A second encoder or a sensor can be connected to the ND 287 through an optional **encoder module** or **analog module** input assembly. The data from the two encoders can be taken into account mathematically via operands. The result and the two measured values are saved. This opens up further areas of application, such as sum/difference display of two encoders or temperature compensation by means of a temperature sensor.

Recording and evaluating measurement series

The ND 287 provides a measured-value memory for the storage of measurement series. Alternatively, during the measurement series, the minimum, maximum, or difference can be displayed. The displayed value can also be checked for tolerance conformity with the sorting function. The saved measured values are evaluated and displayed in the following ways:

- Statistical view (mean value \bar{x} , standard deviation s , and range r)
- Diagram (graph of the measured values with minimum, maximum and mean values, as well as tolerance limits)
- Measured value overview as a table

Statistical Process Control (SPC)

For SPC, the ND 287 saves up to 1000 measured values in its nonvolatile FIFO memory. Evaluation is performed with the following functions:

- Statistical view of the measured values in the FIFO memory
- Measured value overview as a table
- Diagram of the last 30 measured values
- Histogram in ten classes with probability density function and process capability indexes C_p and C_{pk} .
- Control charts for mean value \bar{x} , standard deviation s , and range r

Sorting and tolerance checking

GAGE-CHEK 2000

Evaluation unit for demanding measured-value acquisition

The GAGE-CHEK 2000 evaluation unit is particularly well suited for positioning tasks on positioning, measuring, adjustment and inspection equipment, as well as for the retrofitting of measuring machines in order to collect and transmit data to a PC.

Design

Thanks to its rugged industrial design, the GAGE-CHEK 2000 is superbly suited for applications in measuring rooms and harsh production environments. Its slim aluminum housing, featuring an integrated power adapter and fanless passive cooling system, is exceptionally sturdy and resilient. The unit's straightforward touchscreen, made of specially hardened glass, supports multi-touch gesture control and permits operation with gloves.

Functions

The logical arrangement of menus and function elements provides intuitive user guidance, which supports you while using the different functions. Along with the typical functionality of an evaluation unit, such as zero resetting and preset setting, the GAGE-CHEK 2000 also offers the following practical features:

- Dial gage for a graph of the measured value
- Measurement series with minimum and maximum value recording
- Measurement of master parts (mastering)
- Coupled axis for sum measurement or differential measurement
- Probing functions
- Manual, continuous, touch-probe-triggered, or switching-function triggered measured value output

Data transmission

The measurements can be transmitted via the data interfaces to a PC for processing. The GAGE-CHEK 2000 supports data transmission via RS-232 (adapter) or via Ethernet. For data transmission via Ethernet, HEIDENHAIN supports the MQTT and REST network protocols.

Remote access

The GAGE-CHEK 2000 provides various possibilities for remote access:

- Switching functions
- Position-dependent switching functions
- RS-232 serial interface
- Ethernet

Configurable axis names

The axis names shown in the display can be changed to meet the requirements of the given application. By means of an alias assignment, you can easily change the names of the X, Y and Z axes. The axis names may contain any combination of up to two letters and/or numbers.

Intuitive display

All of the information you need is displayed in a clean and easy-to-read format on the unit's high-resolution, 7-inch screen. Only those functions that are actually available within a given context and situation are shown. The self-explanatory operating elements provide intuitive user guidance.

Diameter/radius display

The "D/R" (diameter/radius) function can be used for radial measurements on rotationally symmetrical parts; for example, in order to switch between the displayed radius and the equivalent diameter. The axes to be given this switching capability can be configured within the function, which can be used on linear axes or on angular axes displayed as linear axes.

Management of parts

The GAGE-CHEK 2000 allows you to configure functions for various objects of measurement and to store them in a structured manner in the function bar. The required measurement functions can thus be selected quickly and easily.

Sum/differential measurement

With the coupled axis, two encoder inputs can be shown linked in the position display. For this purpose, the two encoder inputs are offset against each other as a sum or difference. The result is shown as coupled axis in the position display.

Functions

Configurable function elements

The functionality of the GAGE-CHEK 2000 can be adapted to the given requirements through individually configurable function elements in the Inspector view. Along with function elements for the output of measured values, functions such as a preset table and the storage of minimum and maximum values are available as well.

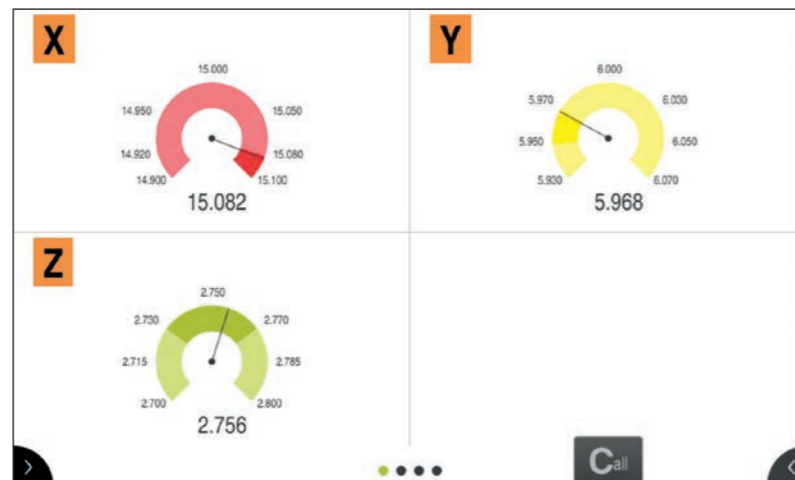

Recording minimum and maximum values (MinMax)

The GAGE-CHEK 2000 is equipped with a function for recording minimum and maximum values. This function can be configured for the axes as desired. The highest and lowest measured values of a measurement series, including their difference, are recorded and can be output over the data interface. This function is particularly advantageous for radial run-out inspection.

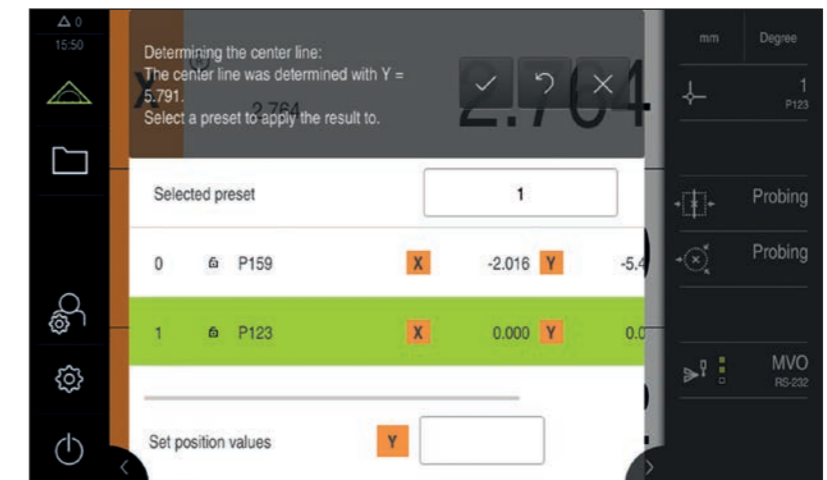

Dial gage

The dial gage function lets you make a direct comparison between the acquired measured values and the nominal value, warning limits and tolerance limits. The measured values are shown as a graph in the form of a dial gage. For evaluation, the GAGE-CHEK 2000 supports you with a color depiction of a dial gage.

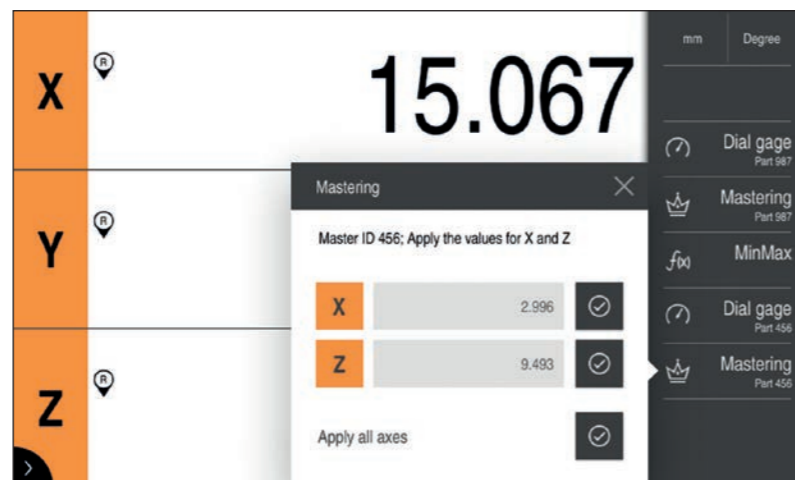

Probing functions

The probing functions support you in determining positions and presets. For these purposes, the GAGE-CHEK 2000 provides edge, centerline and circle-center probing functions.

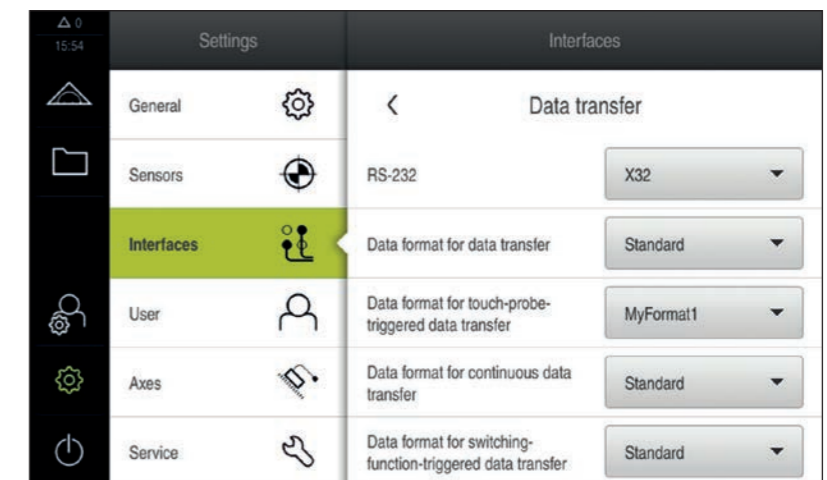

Mastering

With the mastering function, you can reduce influences on the measurement results of a measurement series by using master parts. For this purpose, the master part with its known dimensions is measured regularly. The documented measured values of the master part are taken over either individually or entirely in the position display of the corresponding axes. Regular mastering helps you to improve the accuracy of your measurement series. In addition, you can reuse the measuring setup quickly and easily for new measured objects.

Configurable data formats for measured-value output

For RS-232 data transmission, the GAGE-CHEK 2000 provides a default format and the option of storing your own data formats for data transfer. Thanks to the configurability of its data formats, the GAGE-CHEK 2000 is particularly effective as a data logger on retrofitted, manually operated measuring machines. Within such applications, the GAGE-CHEK 2000 captures the measured values and relays them to a higher-level PC for processing.

EIB 700

Signal converter for computer-aided measured-value acquisition

For use as evaluation units, the EIB 700 signal converters feature connections for four encoders. These units are particularly well suited for the following applications:

- Precise position measurement, especially for inspection stations and multi-gauging fixtures
- Portable, on-site data acquisition (e.g., for machine calibration)
- Integration into customized applications (e.g., high-precision measuring machines)

The EIB 700 series is ideal for applications requiring high-resolution encoder signals and rapid measured-value acquisition. Its Ethernet transmission also enables the use of switches or hubs for connecting more than one EIB. Wireless LAN transmission, for example, can be used as well.

Design

The EIB 700 features a bench-top housing. With a mounting bracket accessory, it can also be easily installed into a 19-inch housing. The device is suitable for the following supply voltages:
EIB 741: AC 100 V to 240 V
EIB 742: DC 24 V

Functions

For **measured-value generation**, the EIB 700 subdivides the signal periods of the incremental signals up to 4096-fold. Automatic adjustment of the sinusoidal incremental signals reduces the error within one signal period.

And thanks to its **measured-value memory**, the EIB 700 series can typically save 250 000 measured values per axis. Based on the axis, these measured values can be saved by means of either an internal or external trigger.

The **interval counter** permits position-dependent triggering in conjunction with an incremental encoder on Axis 1. For this purpose, the signals of Axis 1 are interpolated and forwarded to a position counter. Triggering pulses are generated either at a certain position or equidistantly at configurable intervals. They are continuously generated once a configurable starting position is crossed in either counting direction. The trigger pulses can be used to trigger further internal axes of the EIB or can also be output over a trigger output.

Data interface

A standard Ethernet interface using TCP/IP or UDP communication is available for **data output**, permitting direct connection to a PC, laptop, or industrial PC. The type of measured-value transmission can be selected through the operating mode (single values, as a block, or upon software request).

For **processing the measured values** on a PC, software drivers for Windows, Linux and LabVIEW are included in delivery, as are example programs and the EIB application software. The software driver makes it easy to program customized applications, and the example programs demonstrate the potential of the EIB 700 series. The EIB application software aids with setting up and demonstrating the capabilities of the EIB 700 series. This software is provided as source code and can serve as a platform for the development of one's own applications.

Operating modes	Soft Real-Time	Recording	Streaming	Polling
Properties	Immediate transmission of the measured value upon occurrence of the triggering event	Storage of measured values in the EIB's internal measured-value memory	Buffering and block transmission of measured values	Software request originating from the customer's application
Selectable trigger sources	All internal and external sources			Via software command
Trigger rate	≤ 10 kHz (access time to position values < 100 μs)	≤ 50 kHz	≤ 50 kHz Up to 1 200 000 bytes/s	Depends on the application
Typical applications	Closed Loop control	Very high recording rate Offline data analysis	High recording rate in combination with high recording depth	Semi-static measured value recording

	EIB 741 EIB 742		
Encoder inputs	15-pin D-sub connections (female, X11 to X14), for four encoders		
Interface (switchable)	~ 1 V _{PP} , ~ 11 μA _{PP}	EnDat 2.1	EnDat 2.2

Measured-value trigger ³⁾	Storage of the measured values of the four axes through an external or internal trigger (selectable). External: <ul style="list-style-type: none"> • Signal via trigger input • Software command (over Ethernet) Internal: <ul style="list-style-type: none"> • Timer and interval counter • Reference pulse of the respective axis (from Axis 1 and other axes) 		
Trigger input ⁴⁾	9-pin D-sub connection (male); differential inputs as per RS-485 (terminating resistors can be activated)		
Trigger output ⁴⁾	9-pin D-sub connection (female); four differential outputs as per RS-485		
Access to measured values	Depends on the selected operating mode (see separate table)		
Software	<ul style="list-style-type: none"> • Software drivers for Windows, Linux and LabVIEW • Example programs • EIB application software 		
Data interface ⁵⁾	Ethernet as per IEEE 802.3 (10/100/1000 Mbit/s)		
Network address	Automatic assignment through Dynamic Host Configuration Protocol (DHCP), or manual assignment		
Dimensions	Approx. 213 mm x 152 mm x 42 mm		
Operating temperature	0 °C to 45 °C (storage temperature: 0 °C to +70 °C)		
Supply voltage	EIB 741: AC 100 V to 240 V (±10%), 50 Hz to 60 Hz (±2%); max. power consumption: 30 W EIB 742: DC 24 V (–15%/+20%), max. 2 A		

¹⁾ The supply voltage range of the encoder must be maintained; specified cable length applies when HEIDENHAIN cables are used.

²⁾ Maximum input frequency during referencing: 70 kHz

³⁾ Various trigger sources can be assigned to the individual axes.

⁴⁾ Can also be used as logical input or output

⁵⁾ The quality of the data cable between the EIB and PC must be adapted to the transmission rate and cable length.

IK 220

Signal converter for computer-aided measured-value acquisition

The IK 220 signal converter is an evaluation unit for two axes. As a PC counter card, the IK 220 can be inserted directly into a free PCI slot on the computer.

Design

Connectable to the IK 220 are two HEIDENHAIN encoders with sinusoidal current signals ($\sim 11 \mu\text{A}_{\text{PP}}$), sinusoidal voltage signals ($\sim 1 \text{V}_{\text{PP}}$), or an EnDat 2.1 or SSI interface. External latch inputs/outputs and the output of encoder signals ($\sim 11 \mu\text{A}_{\text{PP}}$) can be implemented by means of additional slot covers (accessory).

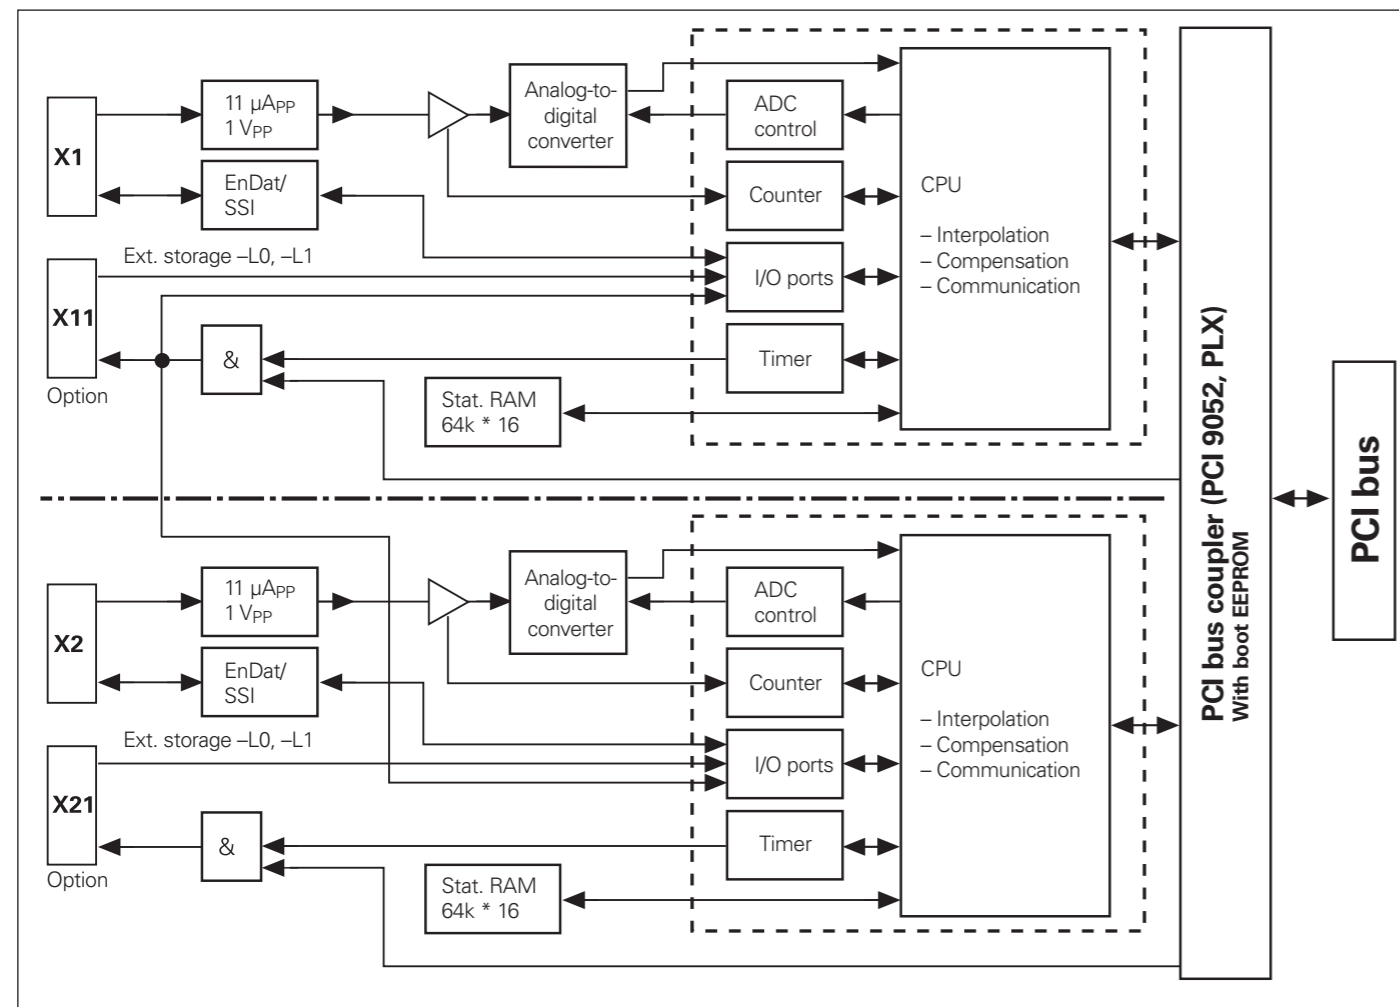

Functions

The IK 220 subdivides the signal periods of the sinusoidal encoder signals up to 4096-fold. The signals are called and stored through either external latch inputs or software.

The IK 220 features an integrated **measured value memory**. A total of up to 8192 measured values can be stored in the buffer memory and can be output as a single block.

Further processing of the measured values in the PC is performed by operator-created programs. To demonstrate the possibilities of the PC counter card, example programs and a software driver are included in delivery.

Interface	PCI bus (plug and play) Local Bus Specification Rev. 2.1				
Software driver and demonstration program	For Windows 7 (32-bit and 64-bit) In VISUAL C++, VISUAL BASIC and BORLAND DELPHI included in delivery Via download: Windows 10 (64-bit)				
Outputs for encoder signals	$\sim 11 \mu\text{A}_{\text{PP}}$ Via PCB connector on the IK (10-pin, female) Fitting cable assembly with PC-slot cover optionally available				
Power consumption	Approx. 4 W, without encoders				
Dimensions	190 mm x 100 mm				
Operating temperature	0 °C to 55 °C (storage temperature: -30 °C to 70 °C)				

¹⁾ With HEIDENHAIN cable; longer cable lengths upon request

Mounting

Mounting the ND 200

ND 200 series

The ND 200 series digital readouts were designed as benchtop units and can be easily stacked. Recesses on the top prevent the stacked units from shifting out of place.

Through threaded holes at the bottom, the ND 28x can be fastened to a base plate with M4 screws.

Two side-by-side ND 28x readouts fit inside a 19-inch housing. For mounting inside a 19-inch housing, a mounting adapter is available as an accessory.

Accessories

Mounting adapter for 19-inch housing
ID 654020-01

ND 287

Mounting the EIB 700

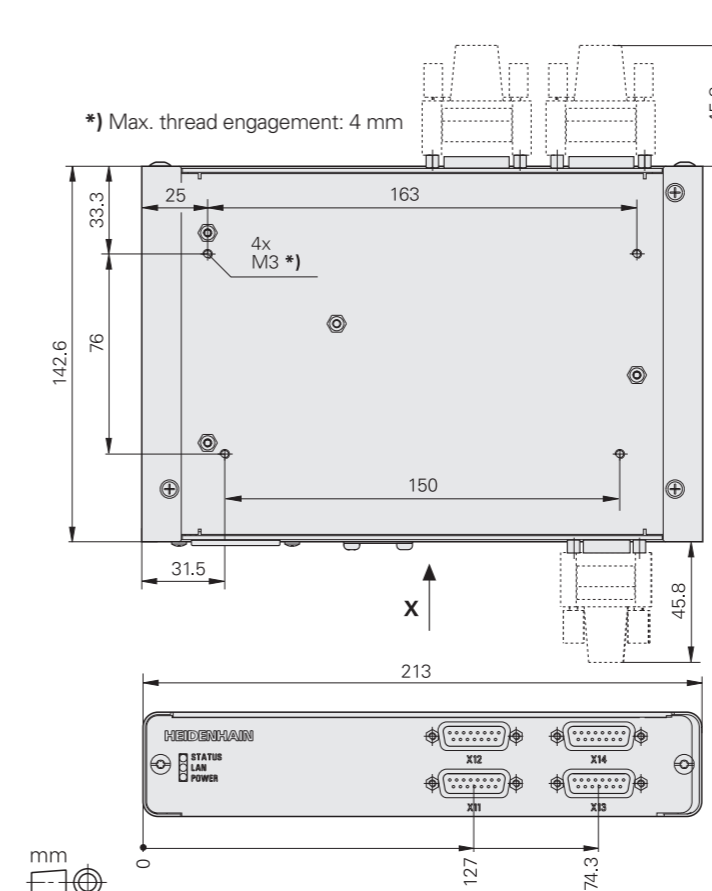

The EIB 700 series was designed as a benchtop unit. It must be installed in a well-ventilated area and at a specified operating orientation.

Through threaded holes at the bottom, the EIB 700 can be fastened to a base plate with M3 screws. Two side-by-side EIB 700 units fit next to each other in a 19-inch housing, occupying one height unit. A mounting bracket is available as an accessory.

Accessories

Mounting bracket

For installation of two EIB 74x units in a 19-inch housing.

Mounting the GAGE-CHEK 2000

With the Multi-Pos or Duo-Pos stand, the GAGE-CHEK 2000 evaluation units can be set up at different angles of tilt. Mounting to the machine can be accomplished with the Multi-Pos holder or with other fastening systems featuring a 50 mm x 50 mm hole pattern.

Multi-Pos stand

For setup on and fastening to a horizontal surface (90° continuous tilt range).

ID 1089230-07

GAGE-CHEK 2000 with Multi-Pos stand

Duo-Pos stand

For setup on and fastening to a horizontal surface (20° or 45° tilt).

ID 1089230-06

Single-Pos stand

Included in delivery. For setup on and fastening to a surface (20° tilt).

ID 1089230-05

Multi-Pos holder

For fastening to an arm (90° continuous tilt range).

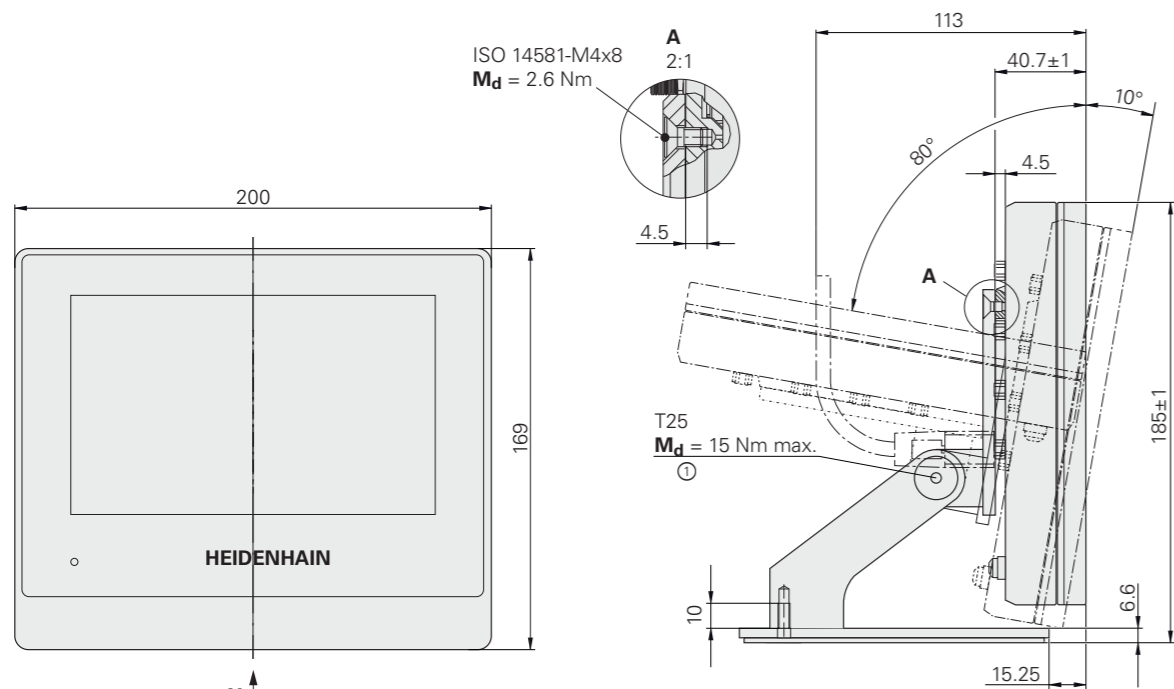

ID 1089230-08

Mounting arm, straight

For fastening to a machine.

ID 1089207-01

Optional assemblies for the ND 287

Various input and output assemblies are available for the evaluation unit.

Second encoder input (option)

The ND 287 evaluation unit can be equipped with an optional second encoder input.

Encoder module

Input assembly for second encoder with a 1 V_{PP}, 11 μA_{PP}, or EnDat 2.2 interface. ID 654017-01

Analog input (option)

Through an optional input assembly, the ND 287 evaluation unit can be equipped with an additional analog input for connecting a sensor. The input voltage range is interpolated 4096-fold; for a sensor with ±10 V, the resolution is therefore 5 mV. The analog module provides DC 5 V, DC 12 V and DC 24 V as supply voltage for the sensor.

The DC 5 V (B) and DC 12/24 V (A) supply voltages are galvanically isolated and must not be used at the same time. A 9-pin D-sub connector is required as a mating connector.

Analog module

Input assembly for the ±10 V analog sensor. ID 654018-01

Ethernet (option)

The ND 287 evaluation unit can be provided with an optional Ethernet module.

Ethernet module

ID 654019-01

This module features an Ethernet 100BaseT interface with an RJ45 connector (8-pin, female), allowing the ND 287 to be connected directly to an internal network or, with a crossover cable, to a PC.

Switching inputs/outputs on the ND 287

Switching inputs

The ND 287 evaluation unit features numerous inputs for external operation and outputs for switching functions. The inputs can be addressed with a pulse or a closed contact.

Exception: the switching inputs for transmitting measured values over the data interface are separate for contact and pulse.

The switching input E is active when a LOW signal U_L is applied (contact or pulse to 0 V).

Signal level

-0.5 V ≤ U_L ≤ 0.9 V with I_L ≤ 6 mA
 3.9 V ≤ U_H ≤ 15.0 V
 t_{min} ≥ 30 ms

Zero reset / set value

Via an external signal, each axis can be set to the display value zero or to a value stored in a parameter (SET).

External control of measurement series Switching the display to MIN, MAX and DIFF

Continuously applying a LOW signal at the corresponding switching input activates the external operation of measurement series. The start of a new measurement series and the switch to the MIN/MAX/DIFF display are then externally controlled through further switching inputs.

Ignoring reference mark signals (reference pulse lock)

When this input is active, the readout ignores all of the reference mark signals. A typical application for this is when linear measurement is performed with a rotary encoder and a lead screw.

Activating or deactivating REF mode

After switch-on or a power interruption, the digital readout can be externally switched to REF mode. The next signal then deactivates REF mode (switching function).

Display with axis coupling

The ND 287 can have an optional second encoder input. Using switching inputs, you can switch the display to individual measured values, a sum, a difference, or any logical operation.

	ND 287
Twelve switching inputs	Zero reset, clear error message Set a preset Ext. control of measurement series or display X1 ¹⁾ Start measurement series or display f (X1, X2) ¹⁾ Display minimum MIN or display X2 ¹⁾ Display maximum MAX or display X1 + X2 ¹⁾ Display difference DIFF or display X1 - X2 ¹⁾ Measured value output (pulse) Measured value output (contact) Ignore reference mark signals (input X1) Ignore reference mark signals (input X2) Activate or deactivate REF mode
Six switching outputs	Display value is "0" Measured value ≥ Switching limit A1 Measured value ≤ Switching limit A2 Measured value > Upper sorting limit Measured value < Lower sorting limit Error

¹⁾ Also selectable by parameter

EIB 700 and IK 220 signal converters

Switching outputs

The ND 287 features open-collector outputs that switch to 0 V (= Active LOW).

Delay until signal output:

$t_v \leq 20 \text{ ms}$

Signal level

$U_L \leq 0.4 \text{ V}$ at $I_L \leq 100 \text{ mA}$

$U_H \leq 32 \text{ V}$ at $I_H \leq 10 \mu\text{A}$

Trigger points (in actual value mode)

When the measured value reaches trigger points defined via parameters, the corresponding output becomes active. Up to two trigger points can be defined.

Switch-off ranges (distance-to-go mode)

In distance-to-go mode, the trigger points function as switch-off ranges, appearing equidistantly from the display value "0".

Sorting limits

When the tolerance sorting limits as defined via parameters are exceeded, the corresponding outputs become active.

Triggering signal for an error

The ND 200 readouts constantly monitor the measuring signals, input frequency, data output, etc., displaying error messages as they arise. If errors occur that have a significant effect on a measurement or data output, the readout sets a switching output to active. This enables monitoring for automated processes.

Zero crossover

At the display value "0", the corresponding output becomes active. The minimum signal duration is 180 ms.

The EIB 700 and IK 220 units feature D-sub connectors for external operation and the connection of encoders.

With the IK 220, the encoder signals can be routed out over an additional slot cover and are available as 11 μA current signals for further processing in evaluation electronics or EXE pulse-shaping electronics. An additional slot cover holds the connections for the external inputs/outputs (e.g., for storing the measured values).

EIB application software for the EIB 700

The EIB application software covers two purposes:

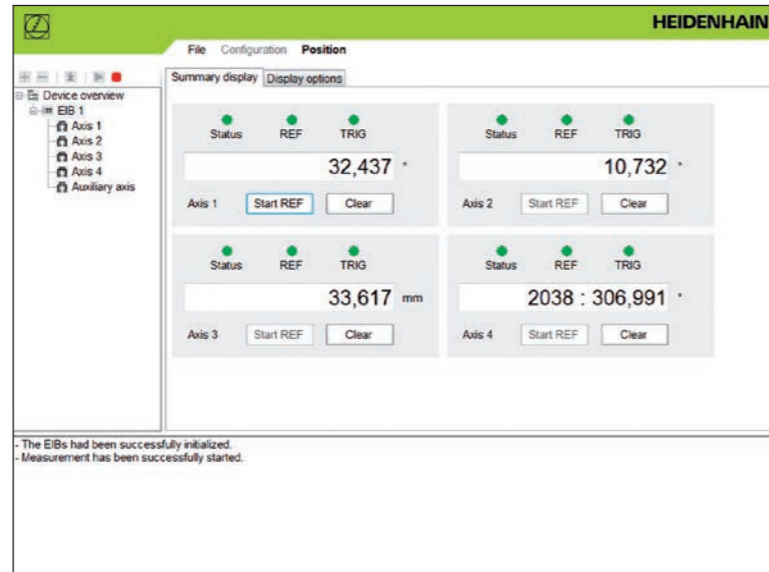

Configuring and demonstrating the EIB 700

- Easy configuration of settings required for operating the EIB 700 (e.g., input interface, data packets, operating mode, trigger settings)
- Management of one or more EIB 700 units
- Simple depiction of the positions transmitted by the EIB 700
- Saving of settings for management of different application projects

For more information, please refer to the User's Guide.

Platform for customized applications

The EIB application software is provided as source code, thereby allowing customers to rapidly implement their own applications. The application software was programmed using C++/CLI and Windows Forms in Visual Studio 2008. This programming environment is widely used in technical application programming but does not necessarily provide state-of-the-art user interfaces such as those in Windows 10. However, adaptation to other graphical interfaces can be performed by the customer.
